                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 5801, Application US/09949016

Patent No. 681239

GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUWAN DISEASE, METHODS OF DETECTION AND USES THEREOF
FILE REFERENCE: CL001307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/241,755

Patent No. 6833446
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Shenk, Michael A.
APPLICANT: McGrath, Annette
APPLICANT: McGrath, Annette
TITLE OF INVENTION: Compositions and Methods for the
TITLE OF INVENTION: Modification of Gene Transcription
FILE REFERENCE: 11000.1021C1U
CURRENT APPLICATION NUMBER: US/09/640,211A
CURRENT FILING DATE: 2000-08-16
NUMBER OF SEQ ID NOS: 2368
SOFTWARE: FastSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                         US-09-640-211A-1308

Sequence 31207, Application US/09270767

Sequence 1207, Application US/09270767

Patent No. 6703491.

GENERAL INFORMATION:

APPLICANT: Homburger et al.

TITLE OF INVENION: Nucleic acids and proteins of Drosophila melanogaster.

TITLE OF INVENION: NUMBER: US/09/270,767

CURRENT APPLICATION NUMBER: US/09/270,767

NUMBER OF SEQ ID NOS: 62517

SOFUTWARE: Patentin Ver. 2.0

LENGTH: 494

Sequence 2026, Application US/09640211A

Patent No. 683446

GENERAL INFORMATION:

APPLICANT: Worderly, Annette

APPLICANT: McGrath, Annette

APPLICANT: GENERAL MACHAW

TITLE OF INVENTION: Compositions and Methods for the

TITLE OF INVENTION: Modification of Gene Transcription

FILE REFERENCE: 11000.10211U

CURRENT APPLICATION NUMBER: US/09/640,211A

CURRENT FILING DATE: 2000-08-16

NOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 2026

LENGTH: 450
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4 5 5 0 4 5 0 4 5 0 4 5 0 4 5 0 4 5 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6 0 4 6

/note="Vector: pBluescript II SK (+) XR; Site 1: EcoRI (5')
end of cDNA); Site_2: MhoI (3') end of cDNA); Outer xylem
from 5 year cold trees harvested every two weeks between
April and October of 2002 at the University of British
Columbia south campus farm in Vancouver, British Columbia.
mRNA was isolated from each tissue source independently
and equal quantities of mRNA from each tissue were then
pooled. cDNA was prepared from 5 micrograms of mRNA and
directionally ligated into the pBluescript II SK (+) XR
vector using the pBluescript II XR cDNA Library
Construction Kit according to manufacturer's instructions
with modifications (Stratagene). Plasmid DNA was then
transformed by electroporation into DHIOB cells
(Invitrogen) for propagation. Normalization was applied
according to published methods [Bonaldo M.F. et al. (1996)
Genome Research 6(9):791] in order to reduce the abundance
of highly expressed transcripte."

/note="Vector: pBluescript II SK (+); Site_I: XhOI;
Site_2: EcoRI; Total RNA was extracted from freeze dried
leaf tissue, using the method described by Wang and Vodkin
(Plant Molecular Biology Reporter 12:132-145, 1994).
POlyAh + mRNA was isolated from total RNA using the
PolyATtract mRNA leolation system III (Promega). The
Ibbary was prepared using the Stratagene pBluescript II
XR CDNA library construction kit. Complementary DNA was
synthesized from mRNA using a Poly (dT) sequence with a
XROI restriction site. EcoRI adapters were ligated to the
blunt ended cDNA fragments followed by restriction with
XhoI. The CDNA insert is protected from XhoI digestion via
methylation during first strand cDNA synthesis. The cDNA
fragments were directionally cloned into the EcoRI-XhoI
restriction site of the pBluescript vector. The ligated
CDNA fragments were transformed into E. coli ElectroMax
DH10B host cells. Transformation efficiency: 1.0E+04
Average insert Size by PCR: 1290 bp"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
beforeamplification was 1.1x10°6 cfu (colony forming units). The background of empty clones was less than 1%. Inserts ranged from 0.5kb to 3 kb, as determined by PCR. Purified plasmid DNA from the primary library was converted to single-strandedcircles and used as a template for PCR amplification using the T7 and T3 priming sites flanking the cloned cDNA inserts. The purified PCR products, representing the entire cloned cDNA population, were used as a driver for normalization. Hybridization between the single-stranded library and the PCR products was carried out for 44 hours at 30C. Unhybridized bNA rendered partially double-stranded and electroporated into DNIOB cells to generate the normalized library. The total number of clones with insert was 9x10°6 cfu. Background of empty clones was less than 1%."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Wagnollophyta; eudicotyledons; core eudicotyledons; rosids; eurosids II; Brassicales; Brassicaceae; Arabidopsis.

/clone_lib="PTXD-IL-N-A-9"
/clone_lib="VetCor: pBluescript II SK (+) XR; Site 1: EccRI (5'
end of cDNA); Site 2: Xhol (3' end of cDNA); Sapling trees
two metres in height and grown under greenhouse conditions
were exposed to continuous feeding by Malacosoma disstria
Hubner (forest tent caterpillar) mid-instar larvae caged
on the sapling using mesh bags. Mature leaves from within
the caged region were collected 2 hours, 12 hours, 24
hours and 48 hours after the onset of treatment. mRNA was
isolated from each tissue source independently and equal
quantities of mRNA from each tissue were then pooled. cDNA
was prepared from 5 micrograms of mRNA and intectionally
ligated into the pBluescript II SK (+) XR vector using the
pBluescript II XR cDNA Library Construction Kit according
to mannifacturer's instructions with modifications
(Stratagene). Plasmid DNA was then transformed by
electroporation into DH10B cells (Invitrogen) for
propagation. Normalization was applied according to
published methods [Bonaldo M.F. et al. (1996) Genome
Research 6(3):791] in order to reduce the abundance of

New transgenic plants for producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel plant transcription factor polypeptides, the DNA sequences which encode them and their use in creating transgenic plants. The transgenic plant and methods are useful for producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen conditions when compared to wild-type reference plants. The present sequence is that of a plant transcription factor gene which was used during the development of the transgenic plants of the invention.
                               transcription factor; transgenic plant; agriculture; drought resistance;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GluArgAlaLeuAlaValTYrAspLy8AspThrProAspArgTrpHi8AsnValAlaLy8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                 The invention relates to a transgenic plant that possesses a plant transformation vector comprising a nucleotide sequence that encodes a peronospora parasitica resistant (PPR2) protein, or a PPR2 orthologue. The transgenic plant is useful in generating plants with a pathogen resistance phenotype. The PPR2 nucleic acids and proteins of the hivornion are useful in the generation of genetically modified plants having a modified pathogen resistance phenotype. The present DNA sequence encodes an Arabidopsis thaliana PPR2 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240

The invention relates to a recombinant polymucleotide comprising any of the 58798 Cotton plant cDNA sequences mentioned in the specification.

Also a recombinant polypeptide comprising any of the 58798 amino acid sequences mentioned in the specification and producing a plant having an improved property.

Comprises transforming a plant with a recombinant construct comprising a promoter region functional in a plant cell operably joined to a promoter region functional in a plant cell operably joined to a promoter region functional in a plant cell operably joined to a polymucleotide comprising a coding sequence for a polypeptide associated with the property, and growing the transformed plant. The polypeptide is useful for improving plant cold tolerance for a manipulating growth rate in plant cells by modification of the cell cycle pathway, improving plant coll tolerance to plant disease, contoucing galactomannan (or lignin or plant growth regulators) improving plant heat tolerance, improving plant tolerance to herbicides, increasing colling in plants, improving plant tolerance conditions or plant growth and development under a least one stress condition; The addor content, improving yield by modification of photosynthesis, wolfying seed oil or protein yield by modification of photosynthesis, or improving yield by providing improved plant growth and development under at least one stress condition. The constructs, in physical arrays of molecules, as plant breeding markers, or in computer-based storage and analysis systems. The present sequence constructs and a plant collection but the sequence constructs and a plant collection but collection be invention where the sequence constructs are constructed and polypeptide may also be used in recombinant DNA constructs. The sequence constructs are constructed and polypeptide and polypeptide may also be used in recombinant plant cDNA of the invention worth the sequence constructs and constructs are necessarily and an analysis systems. The sequence constructs are constructed a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence. Organization of sequence. html/DocID=20040181830. However only 6585 polymucleotide sequences were available, the remaining 52213 polymucleotides and all 58798 protein sequences were not present.
                                                                                                                                                                                                                                                                                                                                                                                    New recombinant nucleic acid molecules and polypeptides from Gossypium hirsutum, useful for producing plants with improved biological characteristics (e.g. improved plant cold or drought tolerance).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 MetalaSerAsnSerArgSerSerIleSerProTrpThrPheSerGlnAsnLysMetPhe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 760 BP; 308 A; 90 C; 144 G; 218 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             760

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at ftp. seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in

  Increased resistance to plant disease, for producing galactomannan, lighting nor plant growth regulators, for increasing the rate of homologous recombination in plants, for inproving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert polymucleotide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LeulleAsnileGluThrGlyArgValProLeuProAsnTyrLysThrPheGluSerAsn 80

The homologous or related genes, for producing compositions that modulate the capression or related genes, for producing compositions that modulate the regions of the protein, in diagnosis, for studying associated pathways, for genetic manipulation of cells, preferably planticells, in screening assays of various plant strains to determine the strains that are capable of withstending a particular disease or environmental stress, for enhancing or inhibiting production of biosynthetic products in plants and to create genetically modified and biosynthetic products in plants and to create genetically modified and crease useful for introducing or improving disease resistance and stress tolerance in plants, screening biologically active agents, such as tolerance in plants, screening biologically active agents, such as conjuncted and insecticides, and for elucidating biochemical pathways. Sequences ABX56649-ABX57647 represent Arabidopsis thaliana polynucleotides of the invention. Note: The sequence data for this patent of a plant of form part of the printed specification but was obtained in

The invention relates to a number of isolated Arabidopsis thaliana CDNA sequences and their encoded proteins which are especially transcription factor related cDNA's and proteins. The isolated or recombinant plant transcription factor polynucleotides and polypeptides are useful in producing transgenic plants with commercially valuable properties, i.e. modified or altered desirable traits as compared to a reference plant, such as an alteration in a plant growth characteristic, e.g. growth rate, germination rate of seeds, vigor of plants and seedlings, or leaf and flower senescence. Sequence information related to the polynucleotides and polypeptides can also be used in bioinformatic search methods. The transgenic plant is useful for growing a progeny plant from a parent plant. This sequence represents one of the cDNAs of the invention.
                                                                                                                                                              New plant transcription factor polynucleotides and polypeptides, useful in producing transgenic plants with commercially valuable properties, such as an alteration in a plant growth characteristic, e.g. growth rate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; SEQ ID NO 356; 454pp; English.

The invention describes a transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the invention can be used to produced a plant having altered traits such as: enhanced tolerance to abiotic stress; glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; early or late flowering; altered flower structure, change in stem bifurcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of trichomes; reduced ectopic trichome development; altered trichome trichome colorens; increased root hairs; altered seed development; altered cell proliferation or cell differentiation; rapid development; altered cell proliferation or cell differentiation; rapid development; premanture seases in root anthocyanins; increase in seeding or plant size; decreased plant size; leaf morphology; seed biochemistry; increase in root anthocyanins; increase in plant cransgenic plant, polynucleotides and polypeptides are useful in bioinformatic search methods. This sequence represents a plant transgenic plant, polynucleotides and polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               167

This invention relates to novel isolated plant nucleic acid molecules, or variants thereof, that encode transcription factors. Specifically, it refers to transcription factor proteins that are cappalle of binding to DNA in order to regulate gene transcription and gene expression in a plants, in particular Eucalyptus grandis and Pinus radiata. The present invention describes DNA constructs containing DNA encoding a cranscription factor that regulates the promoter, which is operably linked to the desired mucleic acid to be expressed. It further provides transgenic plants expressing a transcription factor that confers a trait to the plant such as increased drought, salt or disease tolerance, height contritional characteristics, as well as improved taste, starch composition, flower longevity and germination, amongst others.

CC Accordingly, such plants that are successfully transfected with a DNA construct can be characterized by a difference in flower color, petal or leaf shape and size, aroma or plant height. This polynucleotide is a plant transcription factor cDNA sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel plant transcription factor polypeptides, the DNA sequences which encode them and their use in creating transgenic plants. The transgenic plant and methods are useful for producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen conditions when compared to wild-type reference plants. The present sequence is that of a plant transcription factor gene which was used during the development of the transgenic plants of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  19 MetPheGluArgAlaLeuAlaValTyrAspLysAspThrProAspArgTrpHisAsnVal 38

The invention relates to plant nucleotide sequences that direct seed...

leaf- and/or stem-, panicle-, root- or pollen-specific or -preferential

or constitutive transcription of an operatively linked nucleic acid

segment. The invention also relates to a method for augmenting a plant

segment and a method of identifying a gene, where its expression is

clatered in the seed, leaf, stem, panicle, pollen, root or is constitutive

clanda, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

corghum, rice or wheat. The polymucleotides and the polypeptides they

cencede are useful for manipulating crop plants to alter or improve

phenotypic characteristics, to produce large quantities of oil or

contents, to incur resistance to insecticides, viruses or improve

contents, to incur resistance to insecticides, viruses or fungi, and to

incur stress tolerance (e.g. salt, cold or drought) to ensure the plants

content and nutritional value with reduced apical dominance or dwarfism,

FEATURES

```
crouse were identified by a combination of several methods: Gene prediction programs including Genscan+ (Chris Burge, http://CR-081.mt.edu/GENSCAN.html), GeneMarkHym (Mark Borodovsky, http://Genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant of GlimmerM, see Mihaela Pertea, http://www.rigr.org/scflab/glimmerm.htm/glimmerA.html, and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org), searches of the complete sequence against a peptide database and the plant EST database at TIGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without proteins over medt of their length are annotated as hypothetical proteins Genes encoding tRNAs are predicted by transcriber similarity, the are predicted by more than two gene prediction proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.washington.edu/RM/RepeatMasker.html).

Simple repeats are identified by repeatmasker (Arian) Smit, http://ftp.genome.washington.edu/RM/RepeatMasker.html).

An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al. (1998) Plant J. 15:707-720; Seki et al. (2002) Science 296:141-145). cDNA cleaved with BamHI and XhoI was ligated to modified Lambda FLC-1-E vector (Carninci et al. (2001) Genomics 77:79-90) digested with BamHI and Sall. This clone is in a modified pBluescript vector.

On Apr 18, 2002 this sequence version replaced gi:6598668.

Sequencing, analysis, and annotation were performed within the CSHL/WUSC/ABI Arabidopsis Genome Sequencing Consortium.

Information on physical mapping and YAC and BAC library construction as well as added annotation can be viewed at http://www.cshl.org/arabweb/. We used GenScan, Grail, and MZEF for predicting coding exons and assembling genes. BAC F6F23 maps to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /codon_start=1
